Dynamic Data Generation Suitable for Talking Browser

ABSTRACT

5　　　　　A system and method for transferring information a data processing network. A client device suitable for connecting to the network includes a client application configured to receive information from the network and to present the received information to a user as audio information. The server is configured to provide information to the client data processing device responsive to the client request. The system is configured to determine when at least a portion of

10　　the information provided by the server is unsuitable for presentation by the client and to respond to the determination by storing the information for later access by the user, presenting a visually enhanced version of the information to the user, or providing portions of the information suitable for audio presentation to the user.
